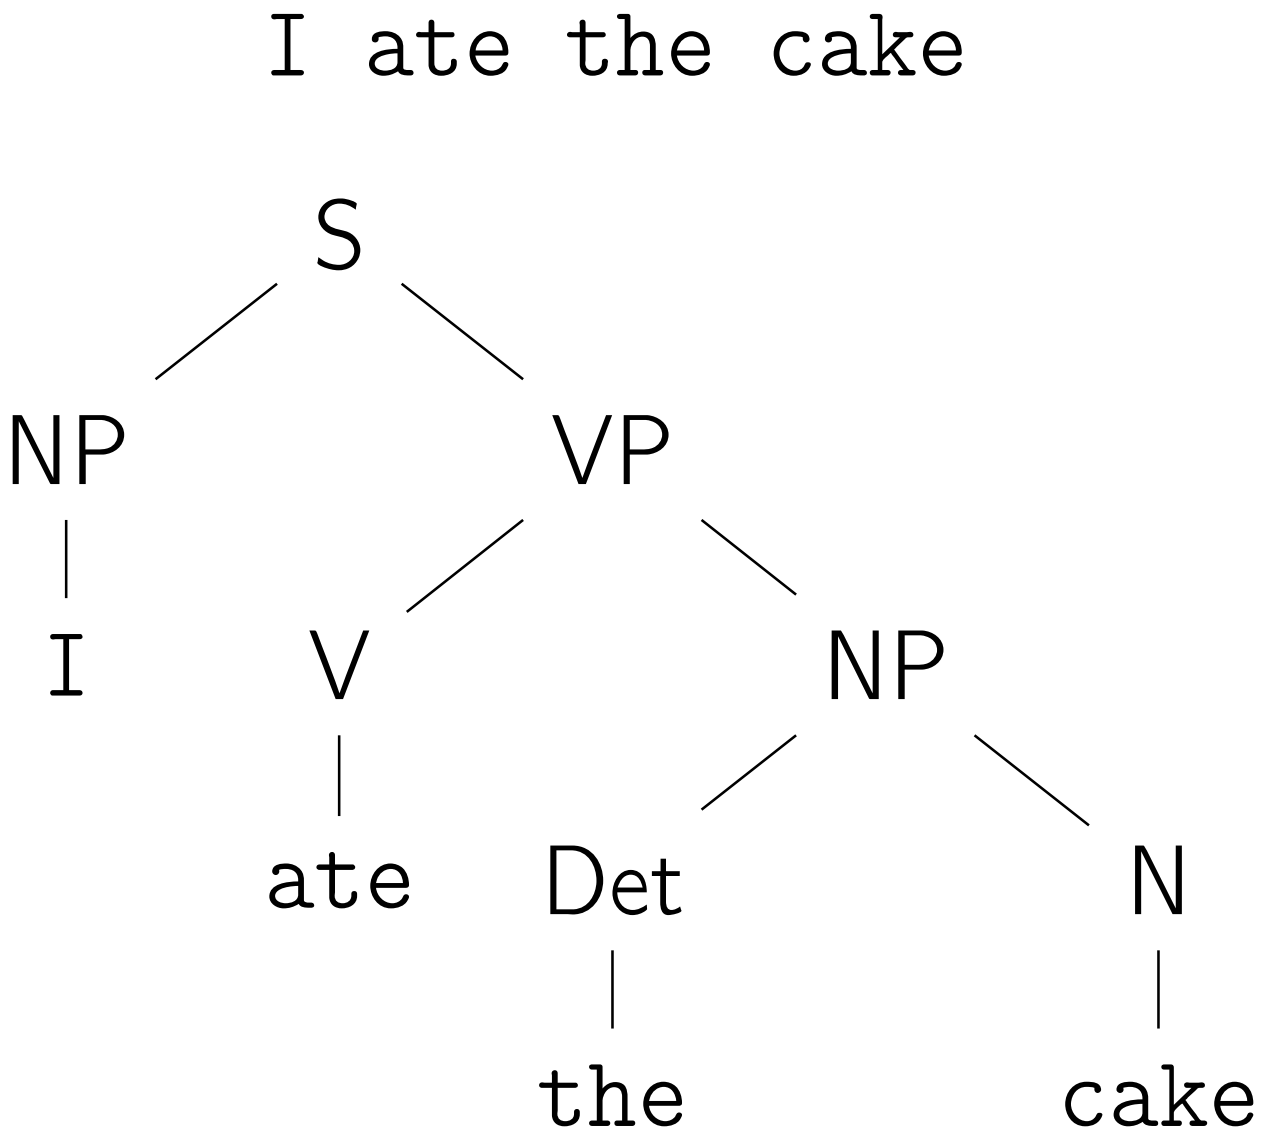
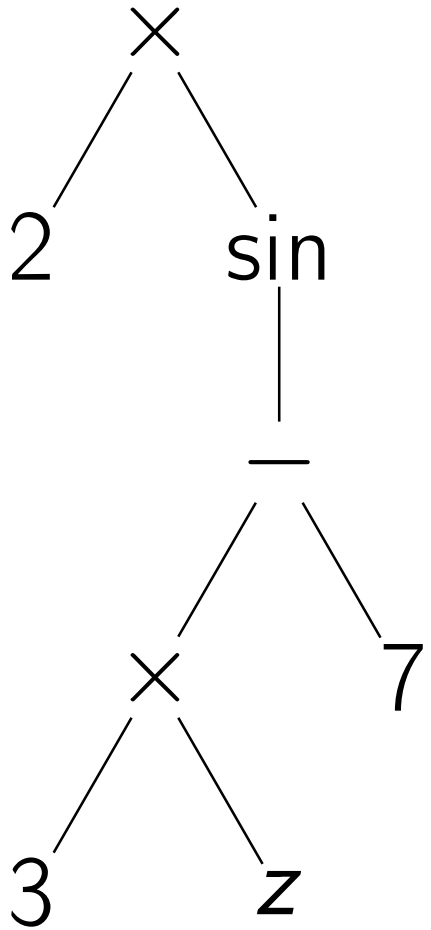
Syntax Tree for a Sentence

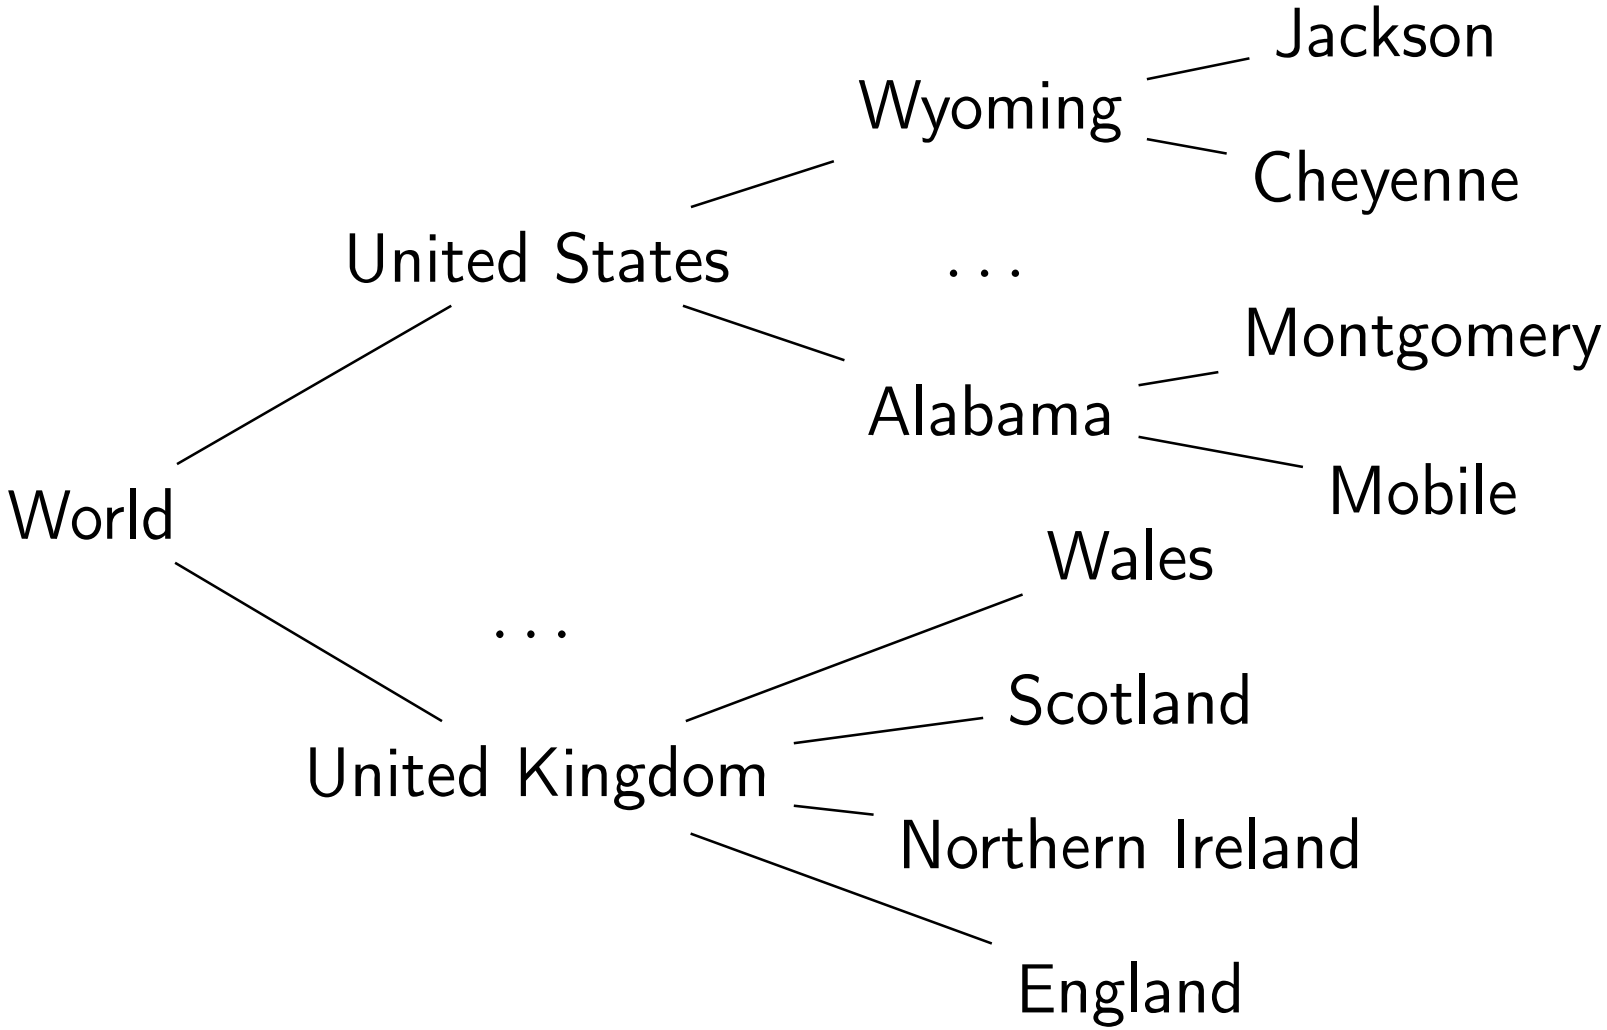


Syntax tree for an Expression

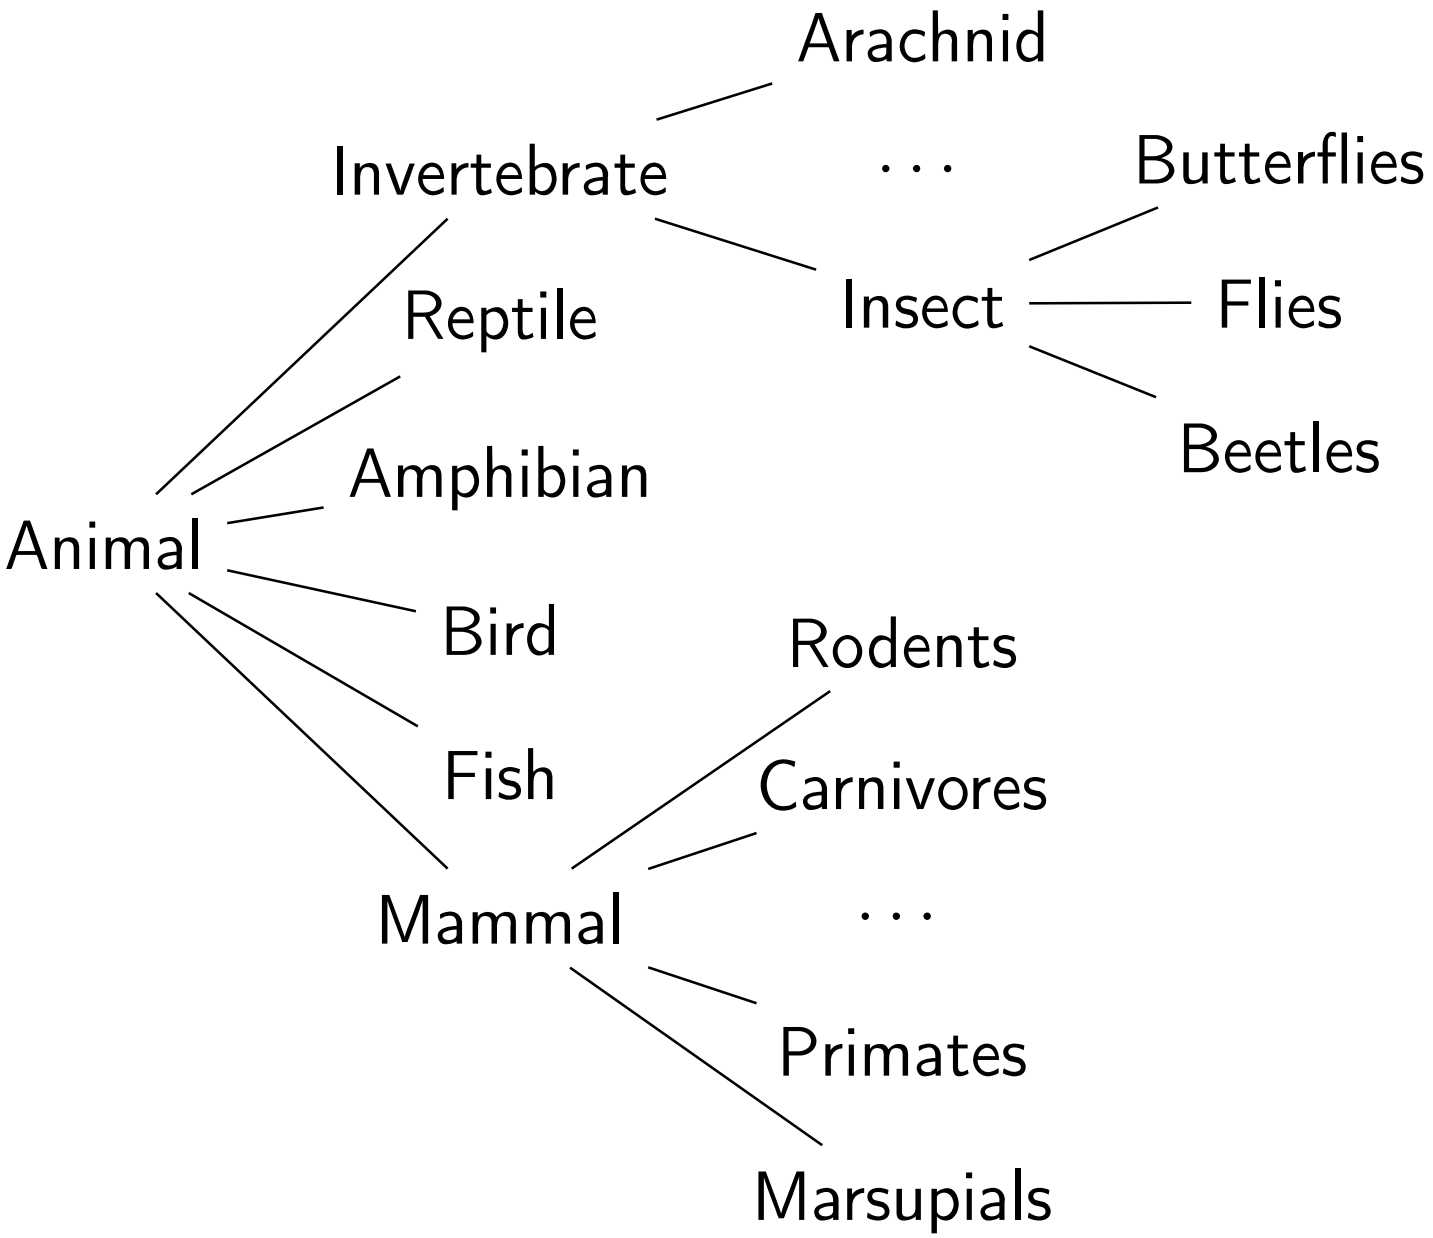
$$2\sin(3z - 7)$$



Geography Hierarchy

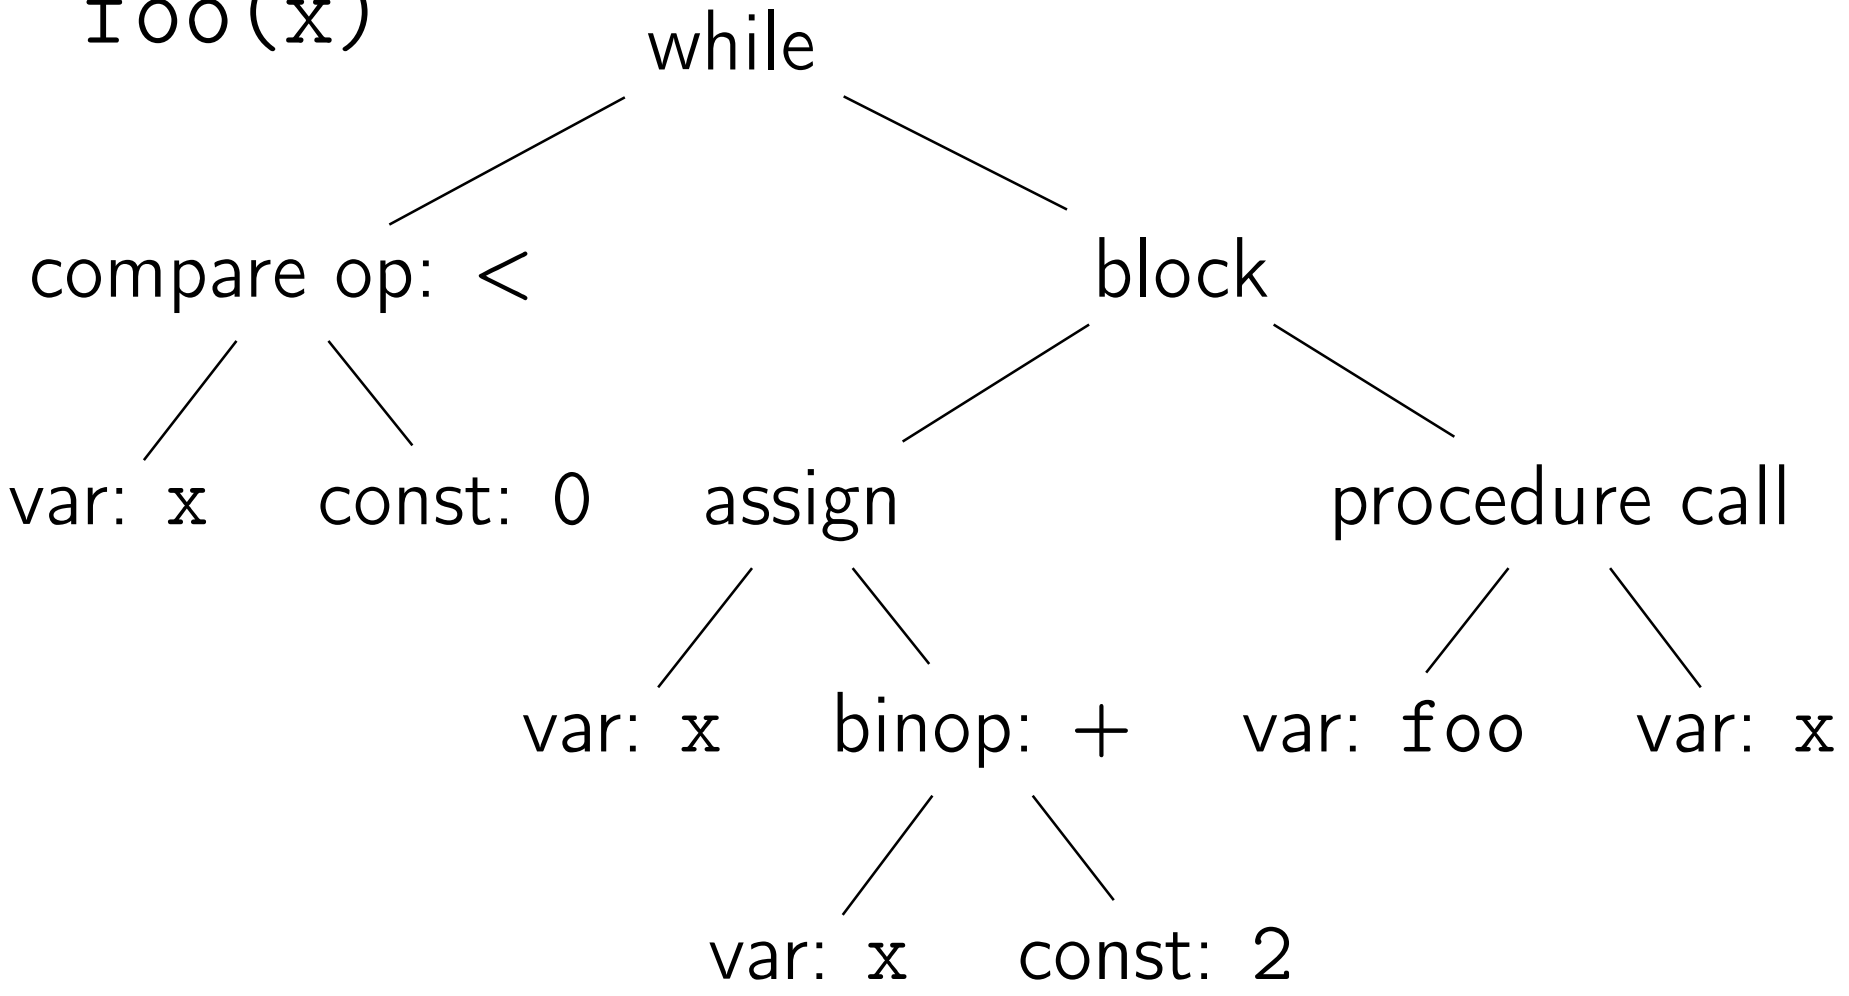


Animal Kingdom (partial)

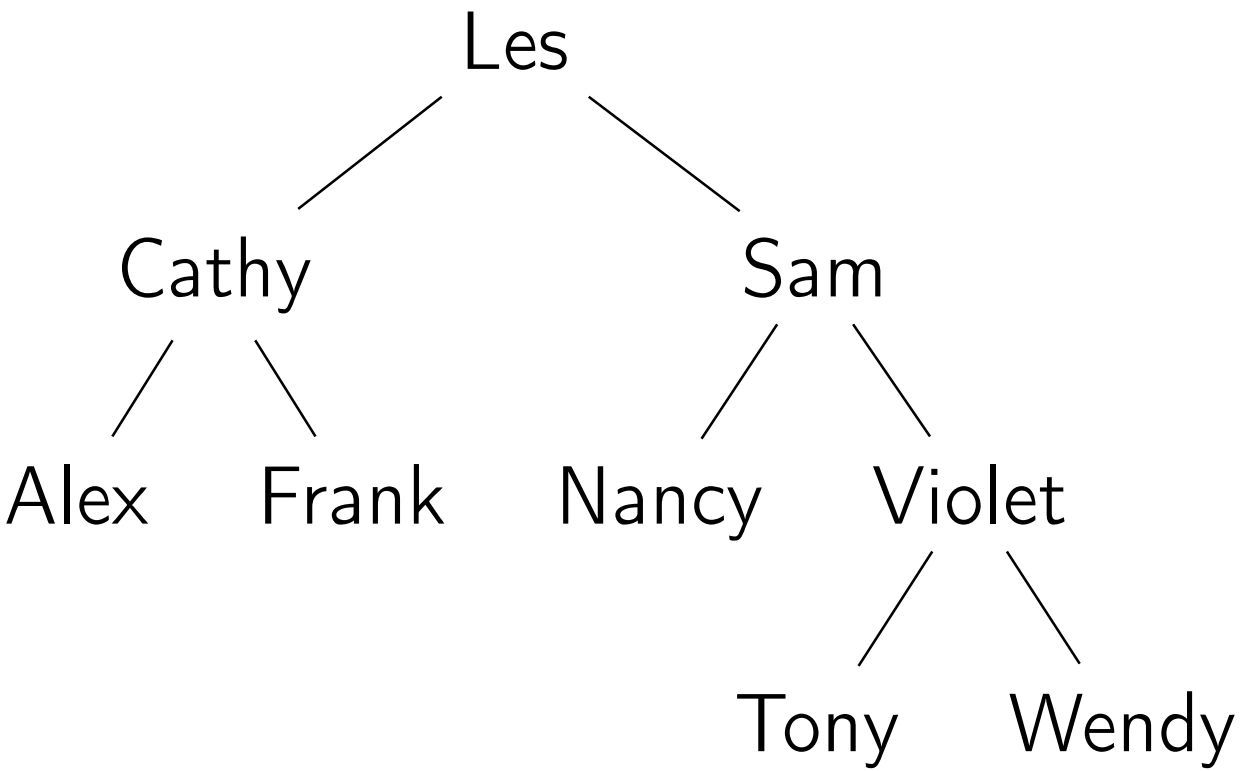


Abstract Syntax Tree for Code

```
while x < 0:
  x = x + 2
  foo(x)
```



Binary Search Tree



Definition

A Tree is:

- empty, or
- a node with:
  - a key, and
  - a list of child trees.

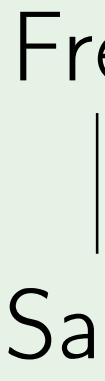
Simple Tree

Empty tree:

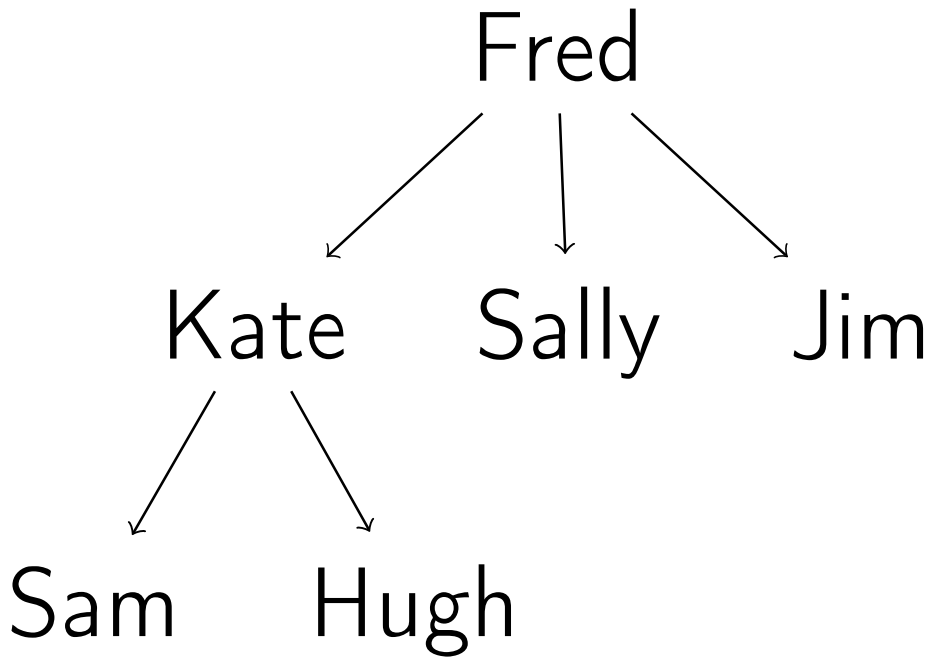
Tree with one node:

Fred

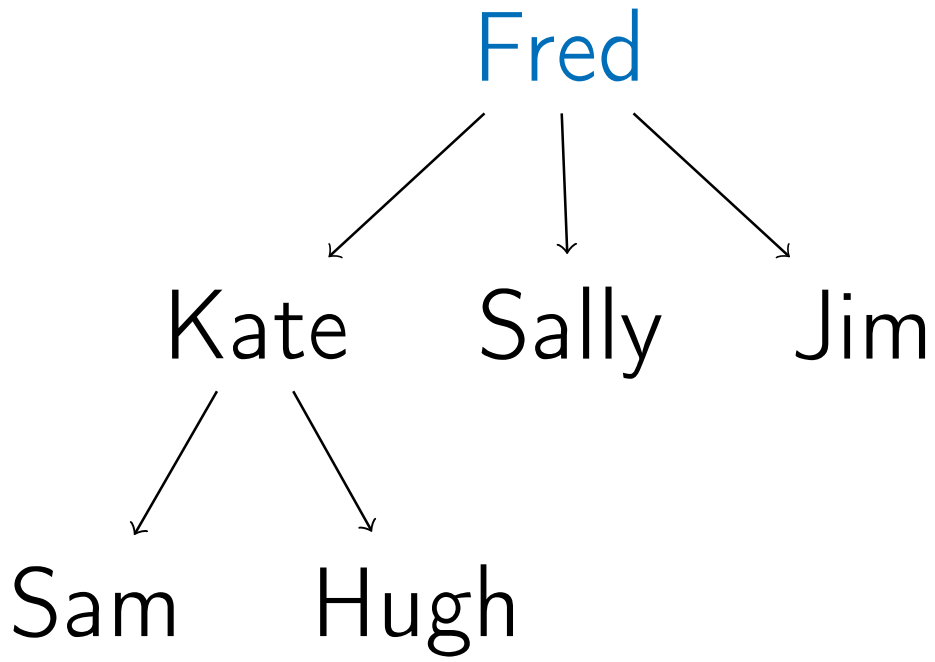
Tree with two nodes:



Terminology



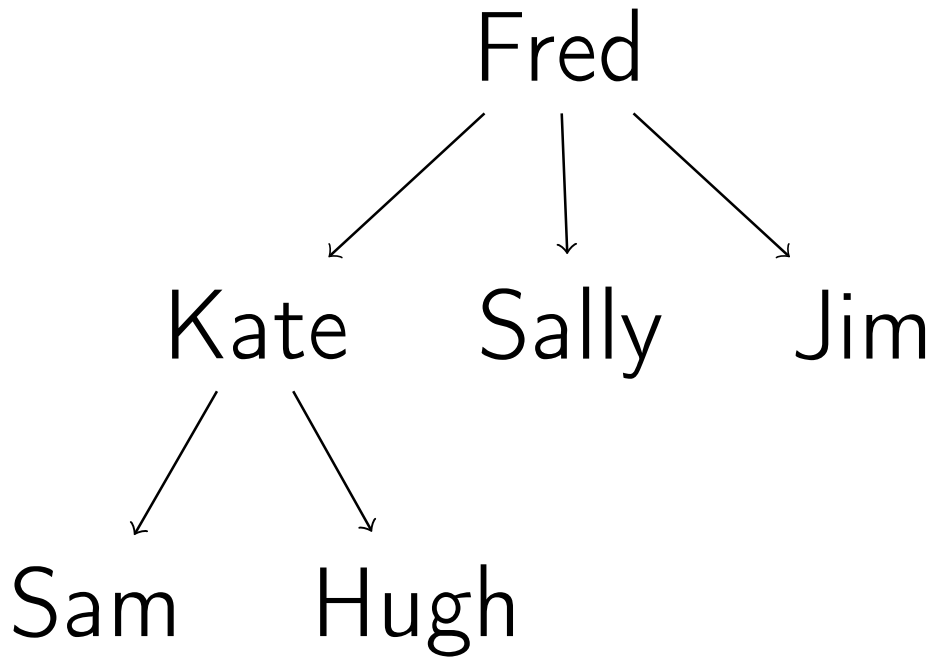
Terminology



***Root*:**

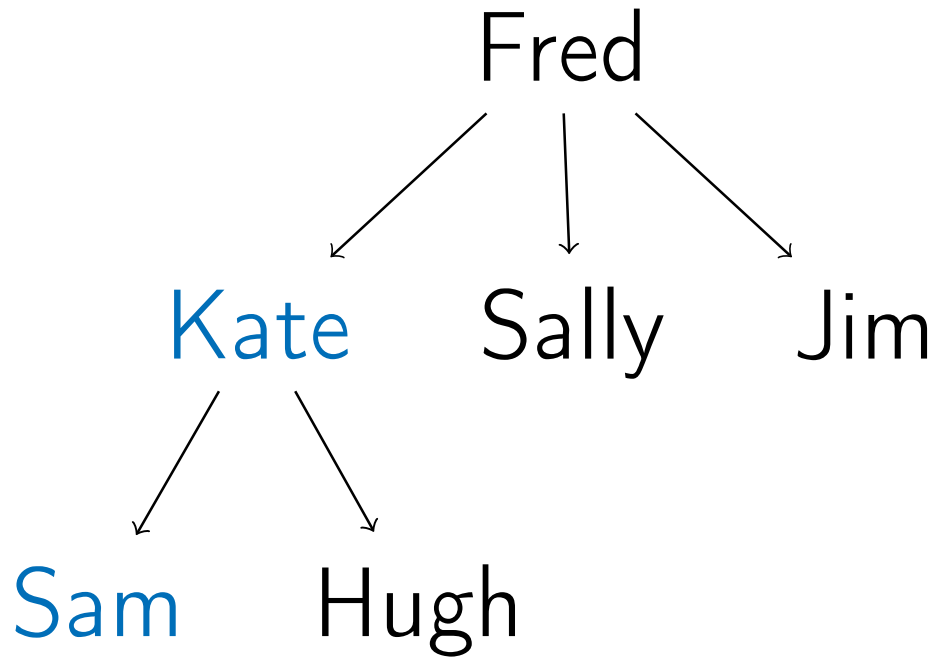
top node in the tree

Terminology



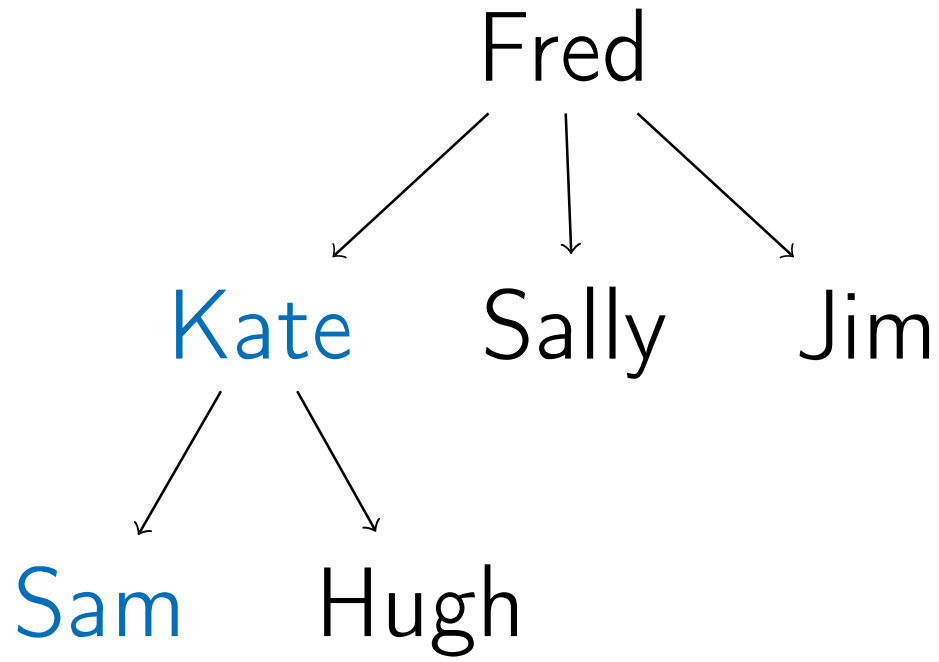
A *child* has a line down directly from a *parent*

Terminology



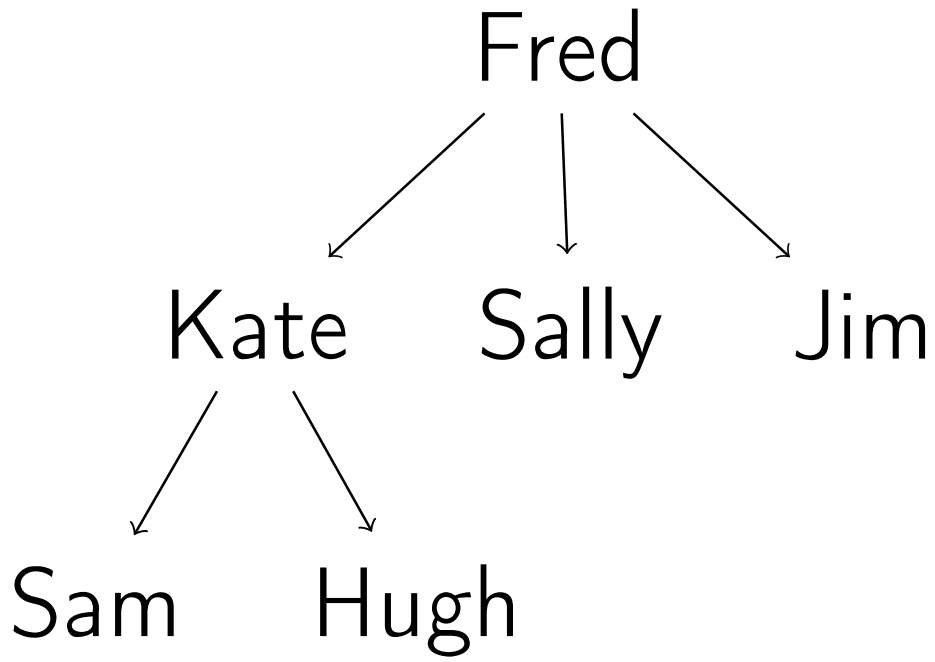
Kate is a *parent* of Sam

Terminology



Sam is a *child* of Kate

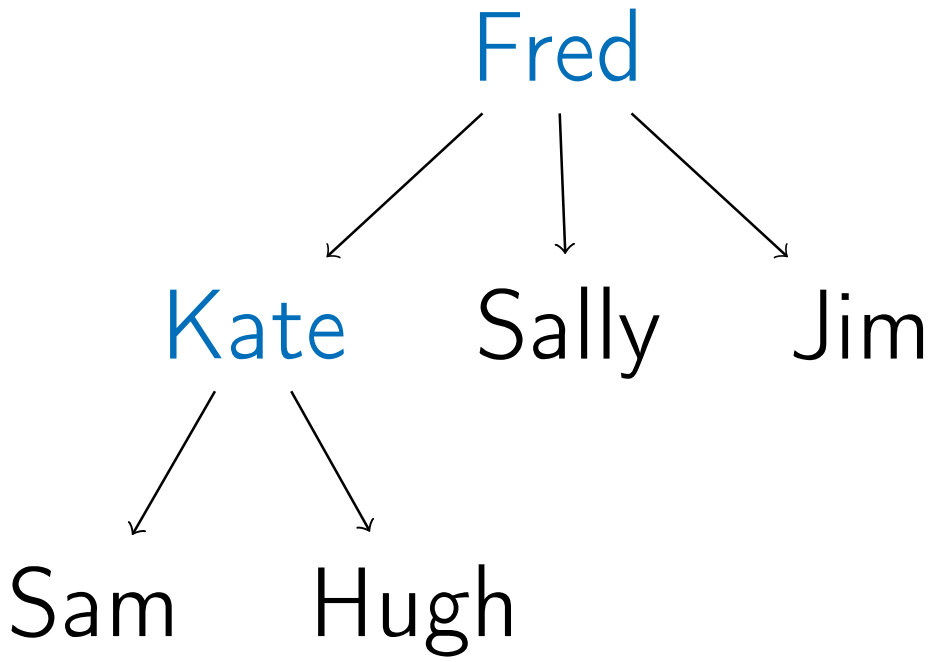
Terminology



Ancestor:

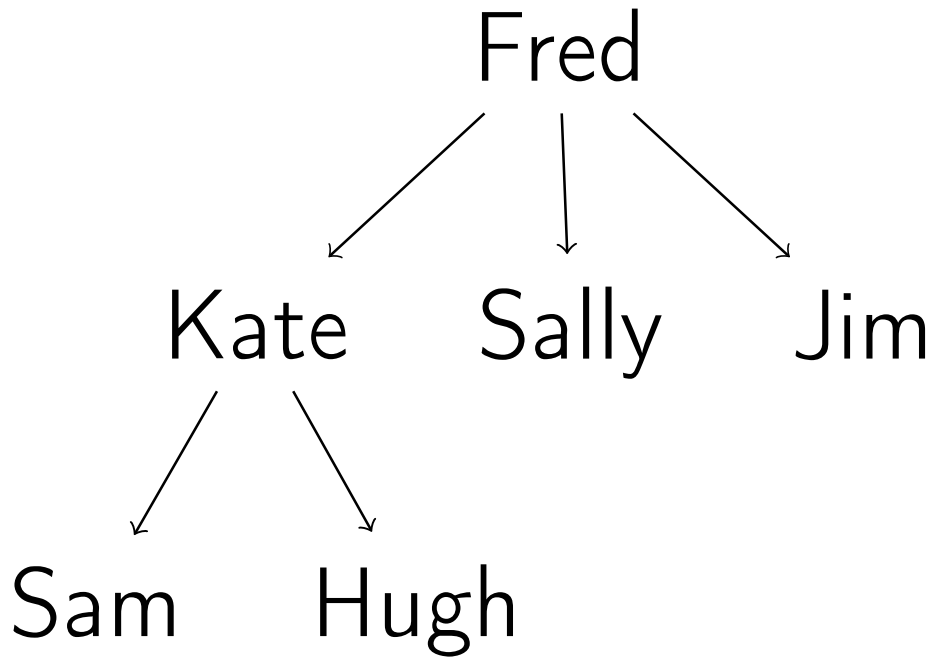
parent, or parent of parent, etc.

Terminology



***Ancestors* of Sam**

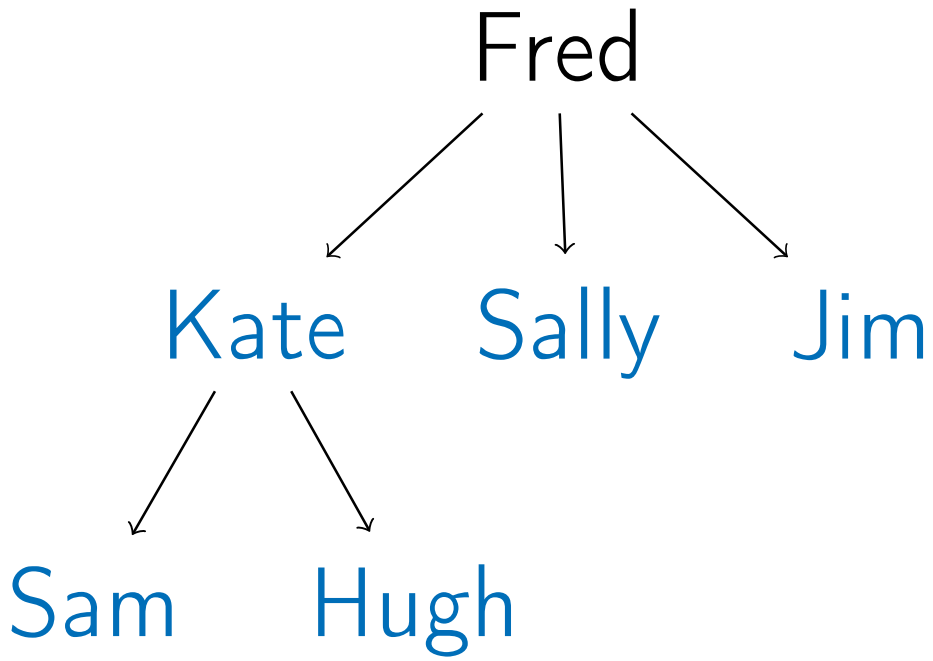
Terminology



***Descendant*:**

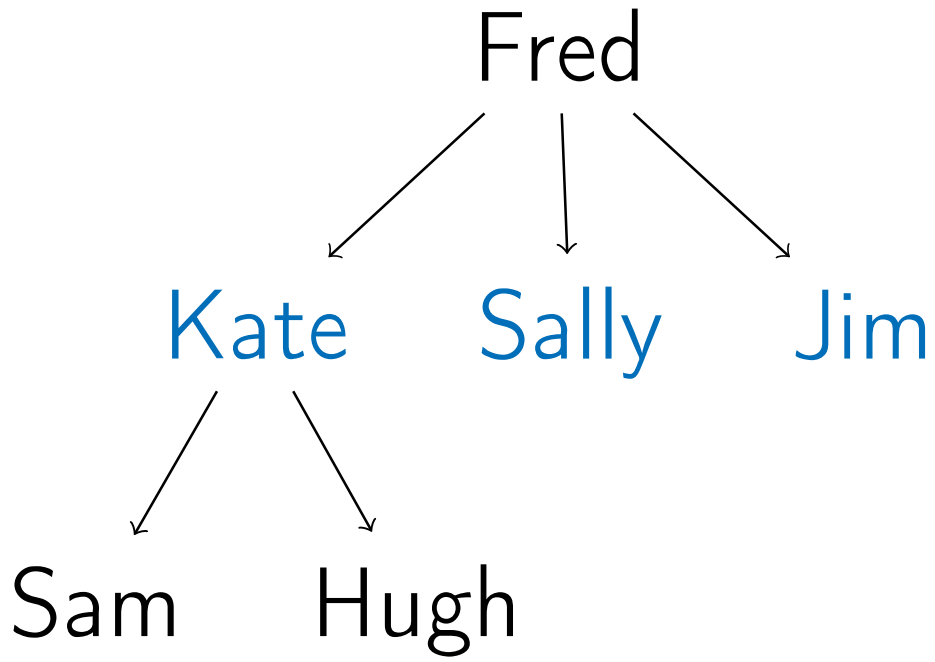
child, or child of child, etc.

Terminology



***Descendants* of Fred**

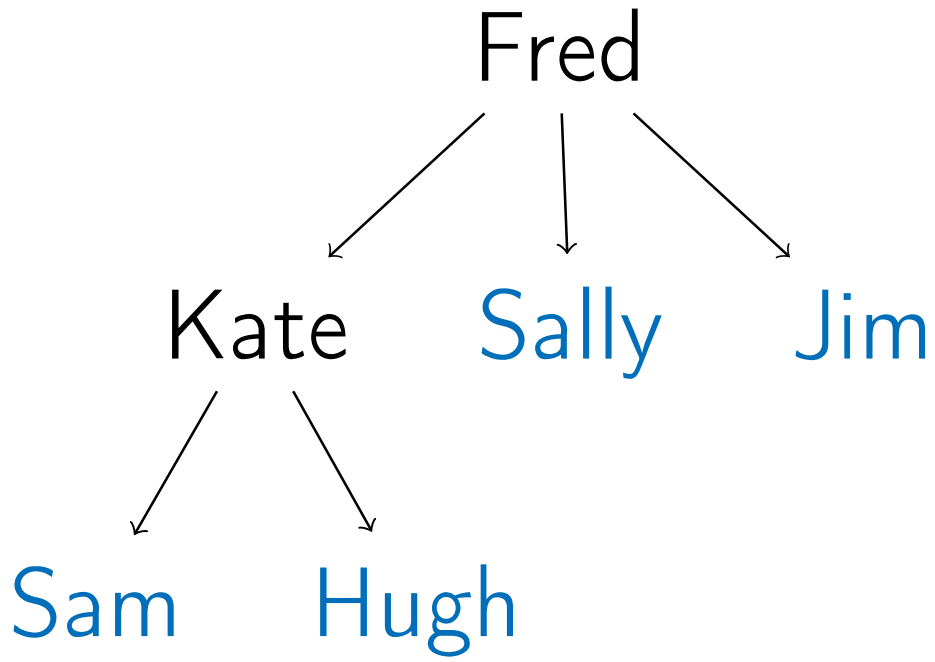
Terminology



Sibling:

sharing the same parent

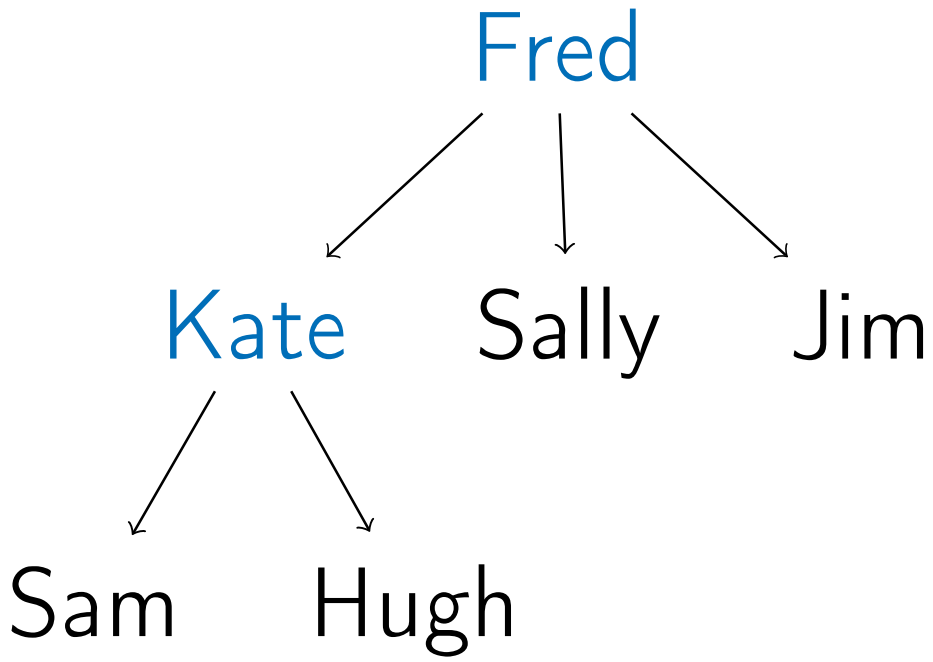
Terminology



***Leaf*:**

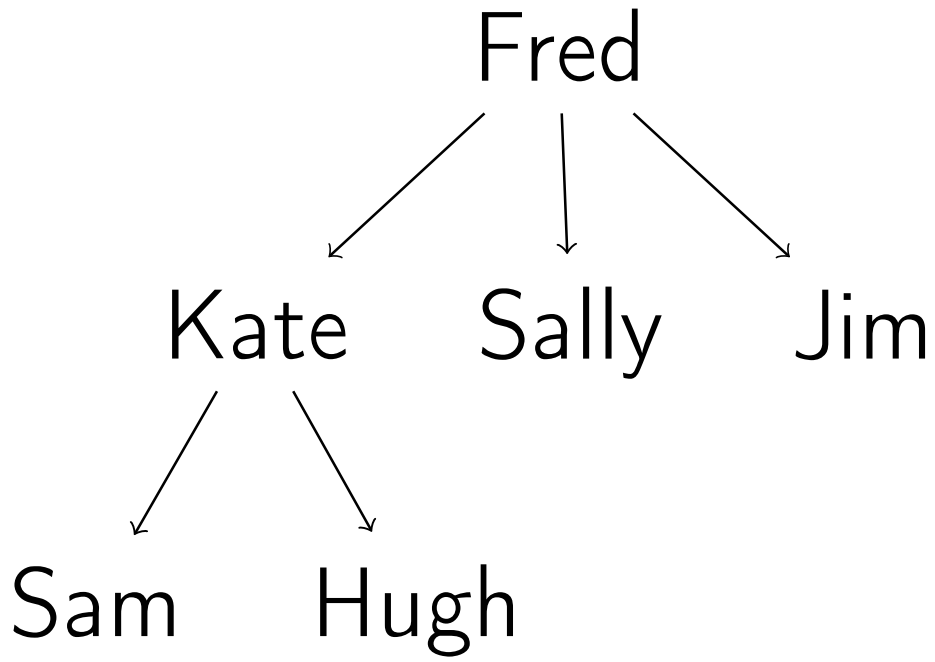
node with no children

Terminology



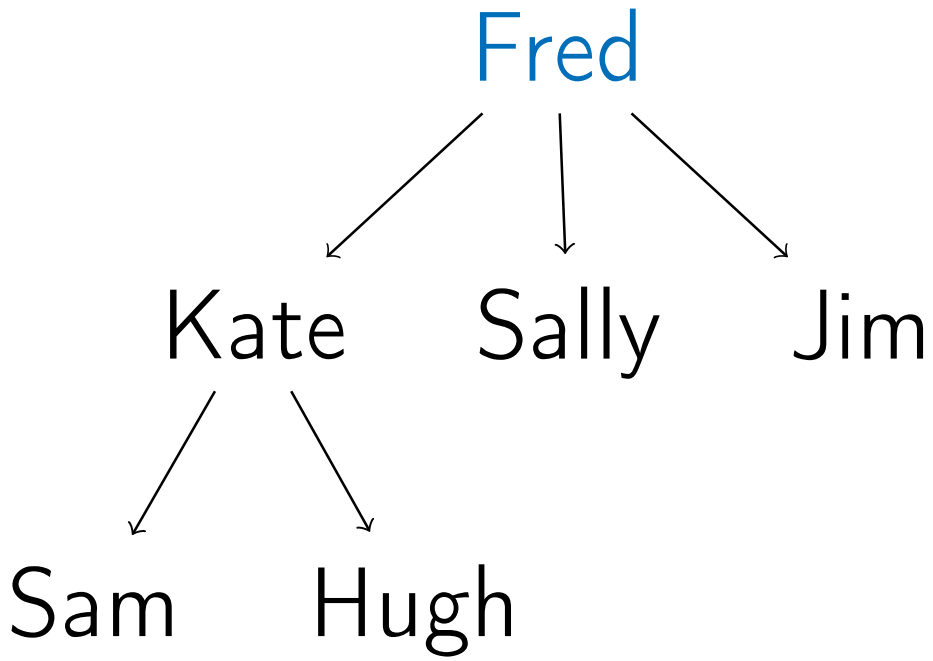
Interior node (non-leaf)

Terminology



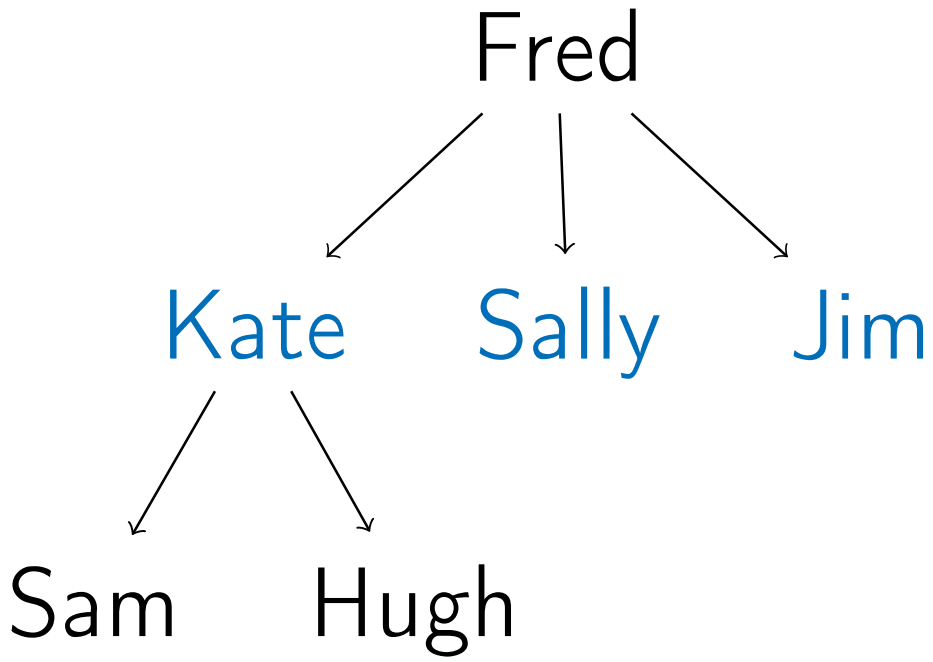
***Level*: 1+ num edges between root and node**

Terminology



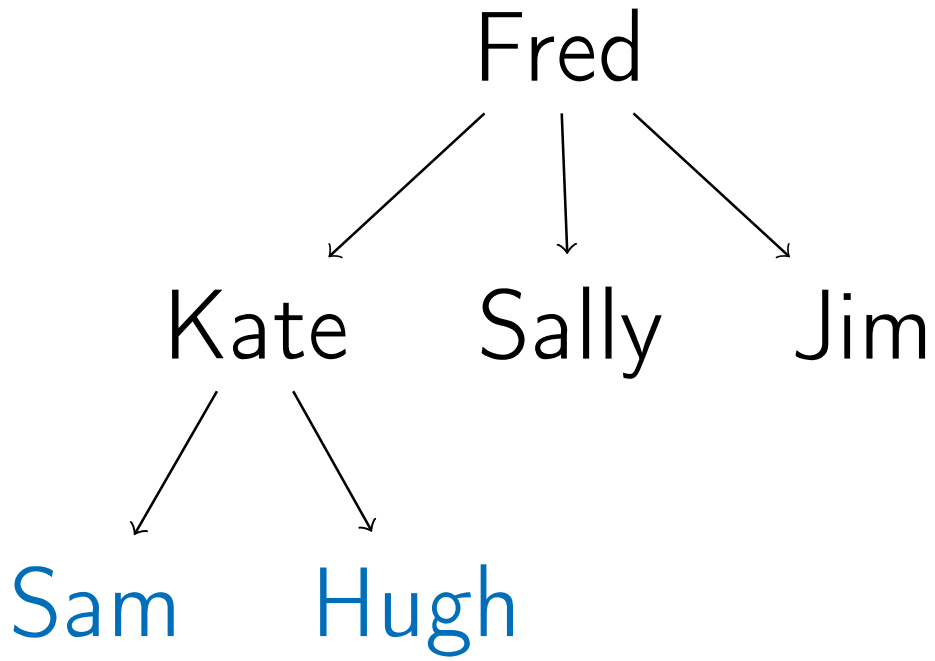
Level 1

Terminology



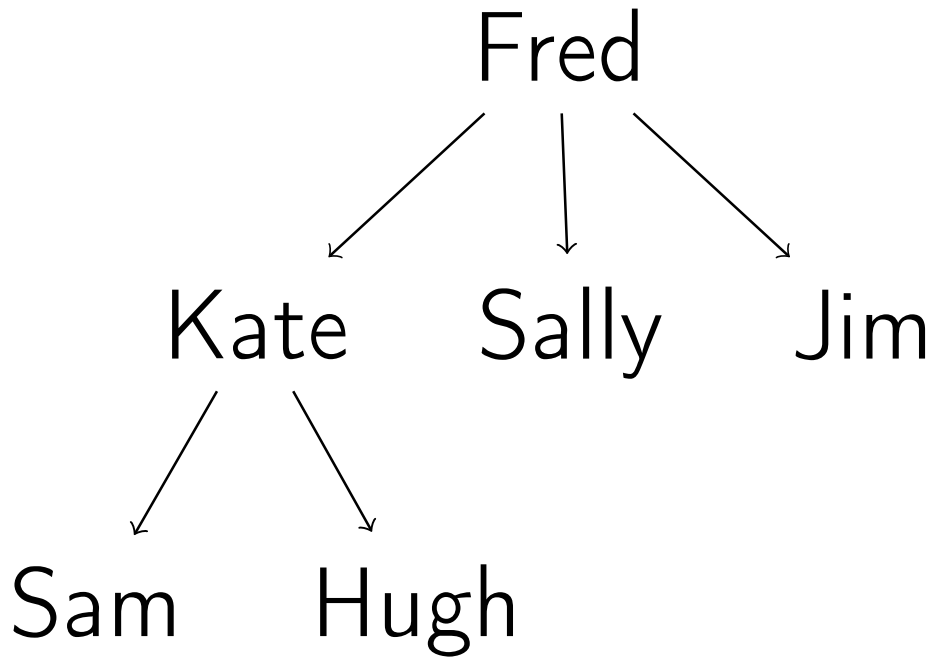
Level 2

Terminology



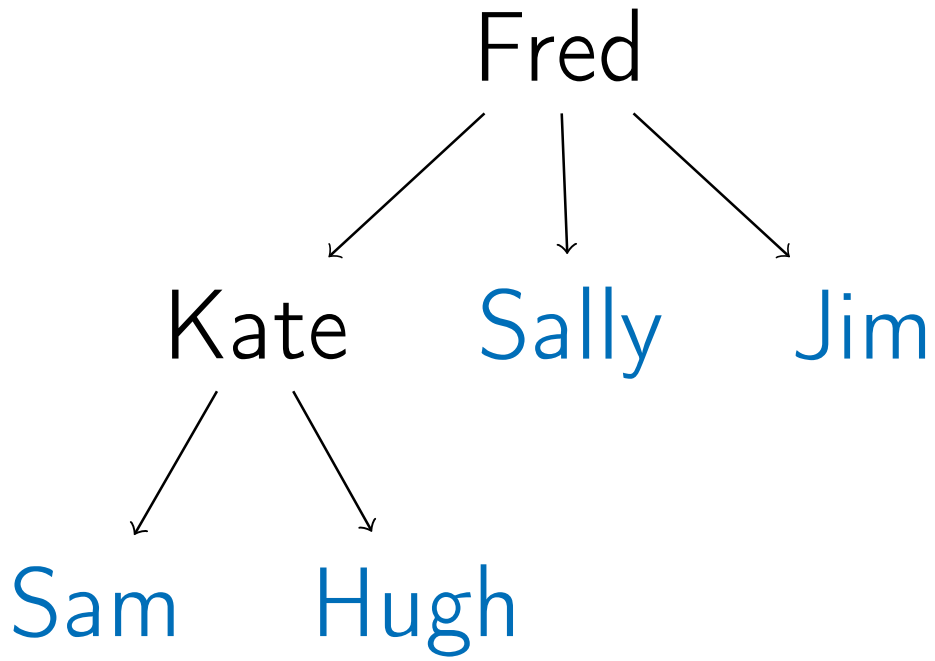
Level 3

Terminology



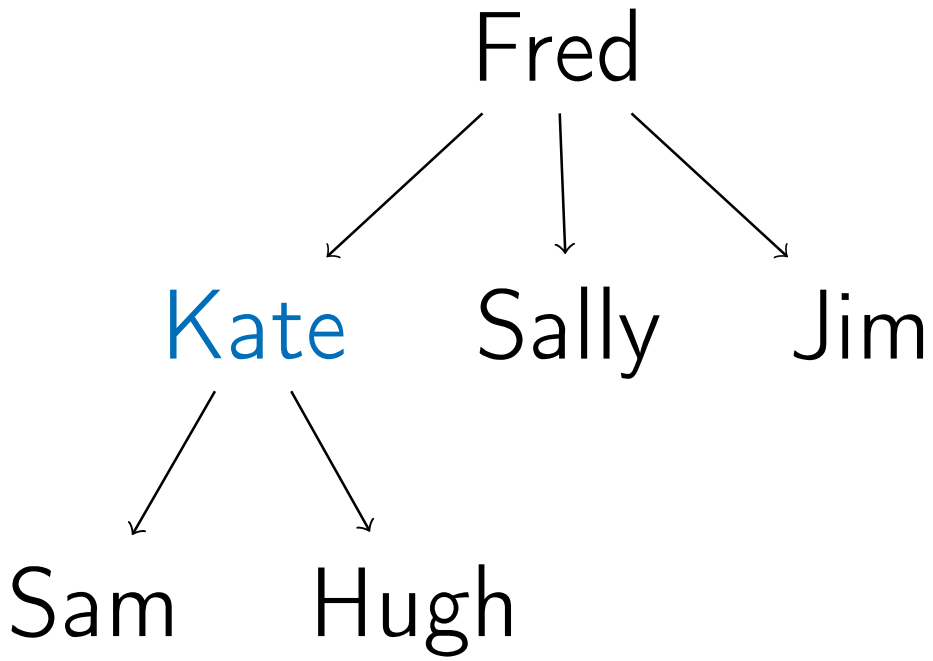
***Height*: maximum depth of subtree node and farthest leaf**

Terminology



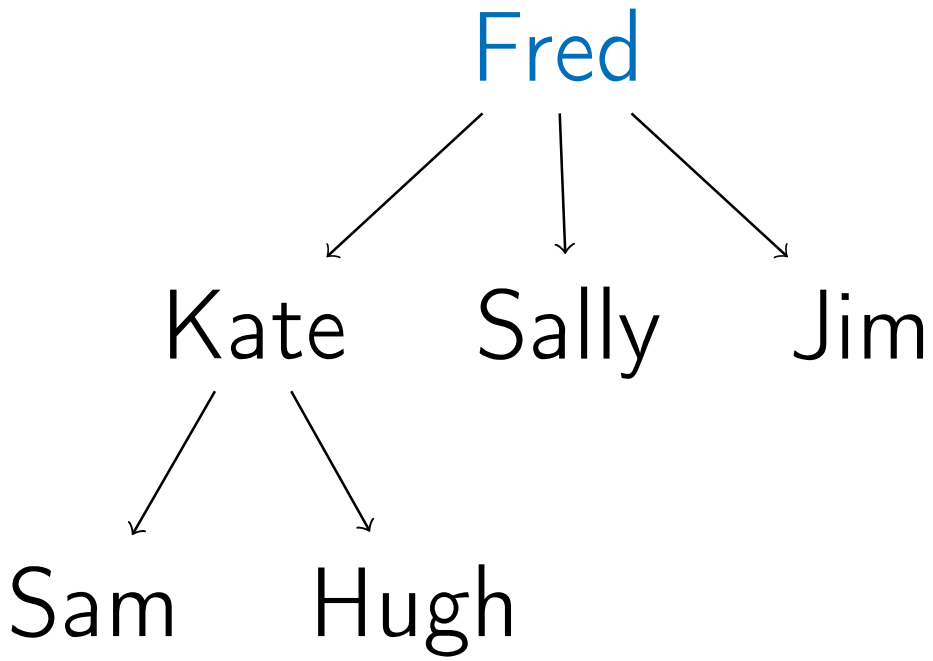
Height 1

Terminology



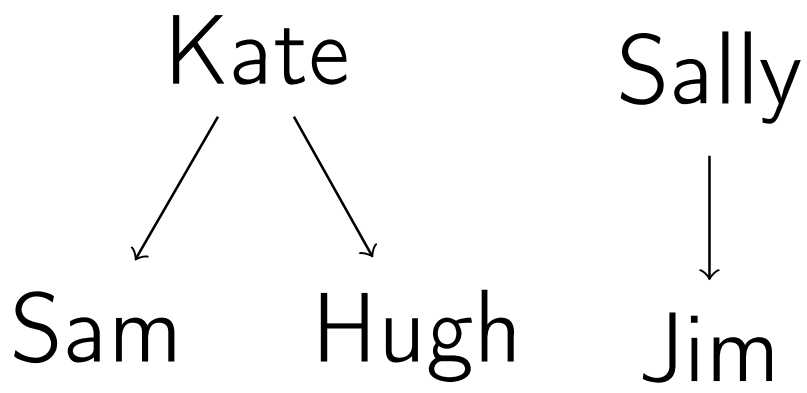
Height 2

Terminology



Height 3

Terminology



***Forest*:**
collection of trees

Node contains:

- `key`
- `children`: list of children nodes
- (optional) `parent`

For binary tree, node contains:

- `key`
- `left`
- `right`
- (optional) `parent`

Height(*tree*)

```
if tree = nil :
   return 0
return 1 + Max(Height(tree.left),
                Height(tree.right))
```

Size(*tree*)

```
if tree = nil
   return 0
return 1 + Size(tree.left) +
           Size(tree.right)
```

Walking a Tree

Often we want to visit the nodes of a tree in a particular order.

Walking a Tree

Often we want to visit the nodes of a tree in a particular order.

For example, print the nodes of the tree.

Walking a Tree

Often we want to visit the nodes of a tree in a particular order.

For example, print the nodes of the tree.

- Depth-first: We completely traverse one sub-tree before exploring a sibling sub-tree.

Walking a Tree

Often we want to visit the nodes of a tree in a particular order.
For example, print the nodes of the tree.

- Depth-first: We completely traverse one sub-tree before exploring a sibling sub-tree.
- Breadth-first: We traverse all nodes at one level before progressing to the next level.

Depth-first

```
InOrderTraversal(tree)
if tree = nil :
  return
InOrderTraversal(tree.left)
Print(tree.key)
InOrderTraversal(tree.right)
```
